Health Assessment of Non-Piggable Overhead Pipelines Using LRUT

In 2024, Oil and Natural Gas Corporation Ltd engaged SOLAS MODU Marine Services to carry out a health assessment of non-piggable overhead pipelines at ONGC facilities in India. As the lines could not be inspected by conventional in-line tools, long range ultrasonic testing (LRUT) was applied as the screening method.

Guided wave equipment screened long runs of pipeline from a limited number of access points, locating indications that warranted follow up evaluation. The results were consolidated into a health assessment of the surveyed lines and reported to ONGC. The work was completed in 2024.

SERVICES PERFORMED

- Long range ultrasonic testing (LRUT)
- Overhead pipeline health assessment
- Assessment reporting to ONGC
- Screening of non-piggable pipelines
- Identification of areas for follow up
